

Digital Technique - Facial Transplant

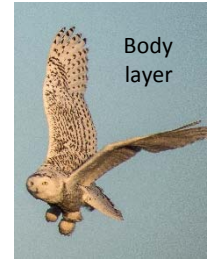

1. Select your two shots to merge

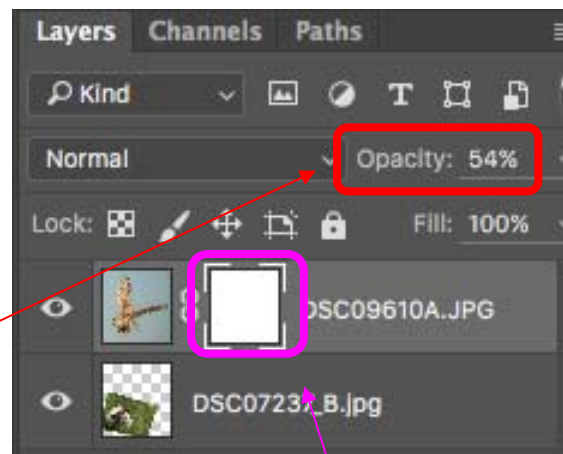

Face layer

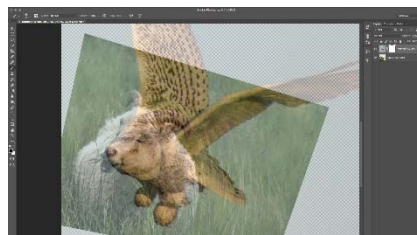

Body layer

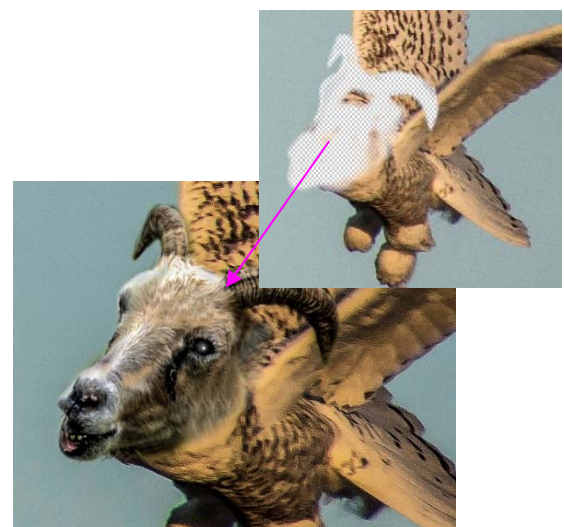

2. Load into separate layers (body on top – face below) and add a mask on the top layer (body)

3. Apply 50% **Opacity** to top layer to reveal face layer underneath and use **Edit / Free Transform** on the face layer to re-size and position the face properly underneath

4. Click on the **mask** on the Body layer and choose the brush tool to carefully paint with black to reveal the face underneath

5. It may take a couple tries but when happy with the final result, Save as .psd first and then as .jpg to flatten to a single image. Use Camera Raw to tweak final overall settings as desired.

Create a few interesting creatures and pick your favorite. Have Fun!!
